

REDUCING MISSED APPOINTMENTS IN A TELEMEDICINE PLATFORM: PRODUCT DECISIONS

Anshul Eskey

BTech Chemical Engineering | IIT Roorkee

PROBLEM IDENTIFICATION

Missed Appointments Are a Join-Time Reliability Problem

- Missed appointments have increased as the platform scales
- Doctor time is underutilized, reducing supply reliability
- Support load rises due to rescheduling and complaints
- Core issue is join-time uncertainty, not lack of intent
- First-time users are most vulnerable to failure

PRODUCT RECOMMENDATION

Post-Booking Commitment & Join-Time Guidance Flow

- Reinforce appointment as a fixed commitment after booking
- Provide clear join instructions and expectations pre-session
- Use action-oriented reminders instead of generic notifications
- Reduce ambiguity around waiting and short delays
- Target first-time users without redesigning the full app

PRODUCT RECOMMENDATION

Post-Booking Commitment & Join-Time Guidance Flow

- Reinforce appointment as a fixed commitment after booking
- Provide clear join instructions and expectations pre-session
- Use action-oriented reminders instead of generic notifications
- Reduce ambiguity around waiting and short delays
- Target first-time users without redesigning the full app

WHY THIS APPROACH

Focused, Fast, and Constraint-Aware

- Directly addresses the dominant failure mode
- Requires low engineering effort and fast rollout
- Respects fixed doctor schedules and capacity limits
- Avoids heavy video or infrastructure redesign
- Delivers impact within a 3-month window

Approach	Effort	Impact
Heavy UI / Video Redesign	High	Medium
Doctor Workflow Changes	High	Medium
Post-Booking Guidance (Chosen)	Low	High

METRICS, RISKS & TRADE-OFFS

Measuring Impact and Acknowledging Limits

North Star Metric

Missed appointment rate (%)

Supporting Metrics

- On-time patient join rate
- Patient no-show rate

⚠️ Guardrails & Trade-offs

Risk :

- Notification fatigue from over-communication
- Doctor-side delays become more visible
- **Attribution risk:** Metric improvements may reflect user mix shifts (e.g., fewer first-time users) rather than intervention impact.

Trade-off:

- Not optimizing for zero cancellations or perfect attribution
